Stringent QA Inspections & Production Management

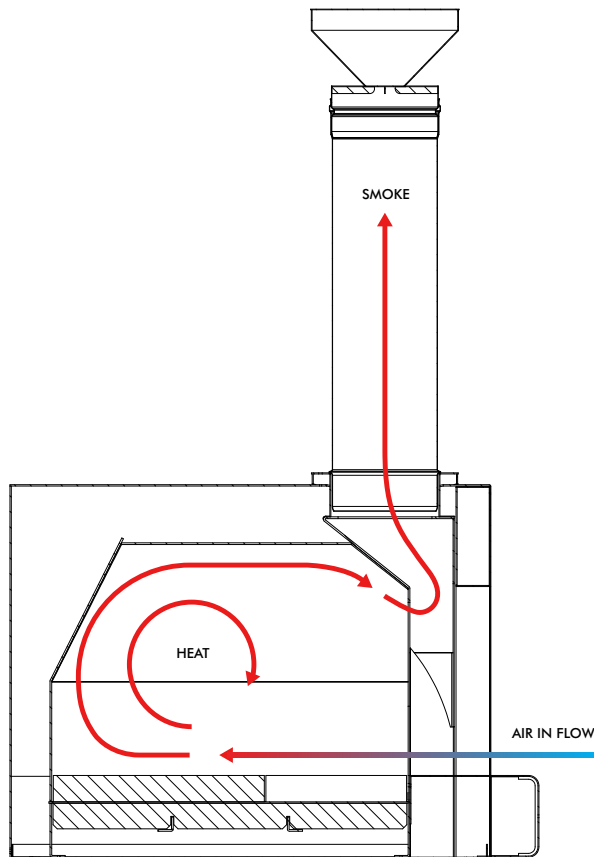

Our own team of Production Engineers and Quality Assurance Inspectors on the factory floor during every step of production.

Over 100 point inspection process.

Spot checks include full assembly of sample oven.

Traditional Flue Design

Heat retention is one of the key benchmarks of performance.

Heat loss reduces cooking temperatures and increases fuel consumption.

Flue opening lower than the top of the dome and just outside the door opening.

Creates a draft pulling smoke out through the door and up the flue and chimney.

Heat is left to circulate within the dome.

Better heat retention and lower fuel consumption.

*Forno Venetia ovens strive to provide the **Best Value** in the outdoor residential wood burning oven category*

Three Models of Ovens

Pronto

(20" x 24" of cooking surface)

Torino

(24" x 32" of cooking surface)
